What are the main data structures in Python?

PRACTICING CODING INTERVIEW QUESTIONS IN PYTHON

Kirill Smirnov

Data Science Consultant, Altran

Data Structure

Data Structure - a specialized format to organize and store data.

Main Data Structures in Python:

- list
- tuple
- set
- dictionary

List

list - an ordered mutable sequence of items (e.g. numbers, strings etc.)

```
my_list = [1, 2, 3, 4, 5]
print(my_list)
```

```
[1, 2, 3, 4, 5]
```

List: accessing items

```
my_list = [1, 2, 3, 4, 5]
                                              print(my_list[1:4])
                                               [2, 3, 4]
print(my_list[2])
                                              print(my_list[2:])
                                               [3, 4, 5]
print(my_list[-1])
```

List: modifying items

```
my_list = [1, 2, 3, 4, 5]

my_list[2] = 30
print(my_list)

[1, 2, 30, 4, 5]
```

```
my_list[:2] = [10, 20]
print(my_list)
```

```
[10, 20, 30, 4, 5]
```

List: methods

```
my_list = [10, 20, 30, 40, 50]
```

```
my_list.append(60)
print(my_list)
```

```
[10, 20, 30, 40, 50, 60]
```

```
my_list.remove(60)
print(my_list)
```

[10, 20, 30, 40, 50]

List: methods

```
my_list = [10, 20, 30, 40, 50]
```

```
my_list.pop()
50
print(my_list)
[10, 20, 30, 40]
my_list.count(40)
```

Tuple

tuple - an ordered immutable sequence of items (e.g. numbers, strings etc.)

```
my_tuple = (1, 'apple', 2, 'banana')
print(my_tuple)
(1, 'apple', 2, 'banana')
my_tuple = 1, 'apple', 2, 'banana'
print(my_tuple)
(1, 'apple', 2, 'banana')
```

Tuple: modifying values

Modifying items in a tuple is not possible.

 $my_tuple[0] = 10$

TypeError

Set

set - an unordered collection with no duplicate items (e.g. numbers, strings etc.)

```
my_set = set([1, 2, 3, 4, 5])
print(my_set)
```

```
{1, 2, 3, 4, 5}
```

```
my_set = set([1, 1, 1, 2, 3, 4, 5, 5, 5])
print(my_set)
```

```
{1, 2, 3, 4, 5}
```

Set: methods

```
my_set1 = set([1, 2, 3, 4, 5])
                                                     my_set1.union(my_set2)
my_set2 = set([3, 4, 5, 6, 7])
                                                     {1, 2, 3, 4, 5, 6, 7}
my_set1.add(6)
print(my_set1)
                                                     my_set1.intersection(my_set2)
{1, 2, 3, 4, 5, 6}
                                                     {3, 4, 5}
my_set1.remove(6)
                                                     my_set1.difference(my_set2)
print(my_set1)
                                                     {1, 2}
{1, 2, 3, 4, 5}
```

Dictionary

dictionary - a collection of key-value pairs where keys are unique and immutable

 $\text{key} \rightarrow \text{value}$

```
fruits = {'apple': 10, 'orange': 6, 'banana': 9}
print(fruits)
```

```
{'apple': 10, 'banana': 9, 'orange': 6}
```

```
fruits = dict([('apple', 1), ('orange', 6), ('banana', 9)])
print(fruits)
```

```
{'apple': 10, 'banana': 9, 'orange': 6}
```

Dictionary: accessing values

Accessing a value for a key:

```
fruits = {'apple': 10, 'orange': 6, 'banana': 9}
fruits['apple']
```

10

```
fruits['grapefruit']
```

```
KeyError: 'grapefruit'
```

Dictionary: modifying values

```
fruits['apple'] = 20
print(fruits)
{'apple': 20, 'orange': 6, 'banana': 9}
fruits['grapefruit'] = 11
print(fruits)
{'apple': 20, 'orange': 6, 'banana': 9, 'grapefruit': 11}
```

```
fruits = {'apple': 10, 'orange': 6, 'banana': 9}

fruits.items()

dict_items([('apple', 10), ('orange', 6), ('banana', 9)])
```

```
fruits = {'apple': 10, 'orange': 6, 'banana': 9}

list(fruits.items()))

[('apple', 10), ('orange', 6), ('banana', 9)]
```

```
fruits = {'apple': 10, 'orange': 6, 'banana': 9}
fruits.keys()
dict_keys(['apple', 'orange', 'banana'])
fruits.values()
dict_values([10, 6, 9])
```

```
fruits = {'apple': 10, 'orange': 6, 'banana': 9}
list(fruits.keys())
['apple', 'orange', 'banana']
list(fruits.values())
[10, 6, 9]
```

```
fruits = {'apple': 10, 'orange': 6, 'banana': 9}
fruits.popitem('banana')
print(fruits)
{'apple': 10, 'orange': 6}
```

Operations on Lists, Tuples, Sets, and Dictionaries

```
my_list = [1, 2, 3, 4, 5]
len(my_list)
```

```
my_set = set([1, 2, 3, 4])
len(my_set)
```

5

```
my_tuple = (1, 2, 3, 4, 5)
len(my_tuple)
```

4

```
my_dict = {'a': 1, 'b': 2, 'c': 3}
len(my_dict)
```

5

3

Operations on Lists, Tuples, Sets, and Dictionaries

```
my_list = [1, 2, 3, 4, 5]
2 in my_list
```

```
my_set = set([1, 2, 3, 4])
5 in my_set
```

True

```
my_tuple = (1, 2, 3, 4, 5)
2 in my_tuple
```

False

```
my_dict = {'a': 1, 'b': 2, 'c': 3}
'b' in my_dict
```

True

True

Let's practice!

PRACTICING CODING INTERVIEW QUESTIONS IN PYTHON

What are common ways to manipulate strings?

PRACTICING CODING INTERVIEW QUESTIONS IN PYTHON

Kirill Smirnov

Data Science Consultant, Altran

String

Create strings:

```
s = 'hello'
print(s)
```

hello

```
s = "hello"
print(s)
```

hello

String

```
str() constructor:

str("hello")

'hello'
```

```
str(11.5)

'11.5'

str([1, 2, 3])

'[1, 2, 3]'
```

str() contructor

```
class NewClass:
    def __init__(self, num):
        self.num = num
nc = NewClass(2)
print(nc.num)
str(nc)
'<__main__.NewClass instance at 0x105cdabd8>'
```

str() constructor

```
class NewClass:
    def __init__(self, num):
        self.num = num

def __str__(self):
    return str(self.num)
```

```
nc = NewClass(3)
str(nc)
```

3

Accessing characters in a string

```
s[1:4]
s = "interview"
s[1]
                                                          'nte'
                                                         s[2:]
s[-2]
                                                          'terview'
                                                         s[:3]
                                                          'int'
```

The .index() method

```
s = "interview"
s.index('n')
s.index('i')
```

Strings are immutable

```
s[0] = 'a'
```

TypeError

```
.capitalize()
.lower()
.upper()
.replace()
```

Methods return a new string object

Modifying methods 1

```
# String concatencation
s1 = "worm"
s2 = s1 + "hole"
print(s2)
```

```
# Replace a substring
s1 = 'a dog ate my food'
s2 = s1.replace('dog', 'cat')
print(s2)
```

wormhole

a cat ate my food

Modifying methods 2

```
# Upper case
s3 = s2.upper()
print(s3)
```

```
# Capitalization
s5 = s4.capitalize()
print(s5)
```

A CAT ATE MY FOOD

```
# Lower case
s4 = s3.lower()
print(s4)
```

```
a cat ate my food
```

A cat ate my food

Relation to lists

Create a string from a list of strings:

```
l = ['I', 'like', 'to', 'study']
s = ' '.join(l)
print(s)
```

I like to study

Breaking a string into a list of strings:

```
l = s.split(' ')
print(l)
```

```
['I', 'like', 'to', 'study']
```

String methods with DataFrames

```
import pandas as pd

d = {'name': ['john', 'amanda', 'rick'], 'age': [35, 29, 19]}

D = pd.DataFrame(d)
print(D)
```

```
name age
0 john 35
1 amanda 29
2 rick 19
```

String methods with DataFrames

D['name'] = # we will modify this column

String methods with DataFrames

```
D['name'] = D['name']
```

String methods with DataFrames

```
D['name'] = D['name'].str
```

String methods with DataFrames

```
D['name'] = D['name'].str.capitalize()

print(D)
```

```
name age
0 John 35
1 Amanda 29
2 Rick 19
```

Let's practice!

PRACTICING CODING INTERVIEW QUESTIONS IN PYTHON

How to write regular expressions in Python?

PRACTICING CODING INTERVIEW QUESTIONS IN PYTHON

Kirill Smirnov

Data Science Consultant, Altran

Definition

Regular expression - a sequence of special characters (metacharacters) defining a pattern to search in a text.

cat

"I have a cat. My cat likes to eat a lot. It also catches mice."

Definition

Regular expression - a sequence of special characters (metacharacters) defining a pattern to search in a text.

cat

"I have a cat. My cat likes to eat a lot. It also catches mice."

Complex patterns

Example:

john.smith@mailbox.com is the e-mail of John. He often writes to his boss at boss@big-company.com. But the messages get forwarded to his secretary at info@big-company.com.

Complex patterns

Example:

john.smith@mailbox.com is the e-mail of John. He often writes to his boss at boss@big-company.com.

But the messages get forwarded to his secretary at info@big-company.com.

Special characters

Simple characters and numbers are mapped onto themselves:

- ullet a o a
- $\bullet \hspace{0.5cm} \mathsf{A} \hspace{0.5cm} \to \hspace{0.5cm} \mathsf{A}$
- $\bullet \quad \boxed{1} \rightarrow \boxed{1}$

Dot maps to anything:

- ullet any character
- . \rightarrow 'a', '1', '"', ...
 - \bullet \. \rightarrow .

Special characters

The following metacharacters represent \ followed by a letter:

• \land w \rightarrow any alphanumeric character or underscore

• \d \rightarrow any digit

\d
$$\rightarrow$$
 '1', '2', '3',...

• \s \rightarrow any whitespace character

\s
$$\rightarrow$$
 '', '\t',...

Square brackets

Several metacharacters can be enclosed in square brackets:

- ullet [aAbB] o a , A , b , B
- $[a-z] \rightarrow a$, b, c,...
- $\bullet \qquad [A-Z] \quad \rightarrow \quad A \quad , \quad B \quad , \quad C \quad , ...$
- $[0-9] \rightarrow 0$, 1, 2,...
- $\bullet \quad \hbox{\tt [A-Za-z]} \ \to \ \hbox{\tt A} \ , \ \hbox{\tt B} \ , \ \hbox{\tt C} \ ,..., \ \hbox{\tt a} \ , \ \hbox{\tt b} \ , \ \hbox{\tt c} \ ,...$

Repetitions

• \star \rightarrow no character or it repeats an undefined number of times

a*
$$\rightarrow$$
 '' , 'a' , 'aa' ,...

• \rightarrow the character is present at least once

a+
$$ightarrow$$
 'a' , 'aaa' , ...

• ? \rightarrow the character exists or not

a?
$$ightarrow$$
 '' , 'a'

• $\{n, m\} \rightarrow \text{the character is present from } n \text{ to } m \text{ times}$

a
$$\{2, 4\} \rightarrow \text{'aa'}, \text{'aaa'}, \text{'aaaa'}$$

Example:

john.smith@mailbox.com is the e-mail of John. He often writes to his boss at **boss@company.com**. But the messages get forwarded to his secretary at **info@company.com**.

$$[\w\.]+@[a-z]+\.[a-z]+$$

Example:

john.smith@mailbox.com is the e-mail of John. He often writes to his boss at **boss@company.com**. But the messages get forwarded to his secretary at **info@company.com**.

[\w\.]+
$$\rightarrow$$
 john.smith , boss , info

at least one letter, digit, underscore, or dot character

Example:

john.smith@mailbox.com is the e-mail of John. He often writes to his boss at **boss@company.com**. But the messages get forwarded to his secretary at **info@company.com**.

$$@ \rightarrow @$$

Example:

john.smith@mailbox.com is the e-mail of John. He often writes to his boss at **boss@company.com**. But the messages get forwarded to his secretary at **info@company.com**.

$$[a-z]+$$
 \rightarrow mailbox , company

at least one lowercased letter

Example:

john.smith@mailbox.com is the e-mail of John. He often writes to his boss at **boss@company.com**. But the messages get forwarded to his secretary at **info@company.com**.

$$[\w\.]+@[a-z]+ \. [a-z]+$$

$$\setminus$$
 . \rightarrow .

Example:

john.smith@mailbox.com is the e-mail of John. He often writes to his boss at **boss@company.com**. But the messages get forwarded to his secretary at **info@company.com**.

[a-z]+
$$\rightarrow$$
 com

at least one lowercased letter

re package

```
import re
pattern = re.compile(r'[\w\.]+@[a-z]+\.[a-z]+')

text = 'john.smith@mailbox.com is the e-mail of '\
'John. He often writes to his boss at '\
'boss@company.com. But the messages get forwarded '\
'to his secretary at info@company.com.'
```

re.finditer()

```
result = re.finditer(pattern, text)
print(result)
<callable_iterator object at 0x7f5dff81af98>
for match in result:
    print(match)
<_sre.SRE_Match object; span=(0, 22), match='john.smith@mailbox.com'>
<_sre.SRE_Match object; span=(77, 93), match='boss@company.com'>
<_sre.SRE_Match object; span=(146, 162), match='info@company.com'>
```

re.finditer()

print(match.end())

```
result = re.finditer(pattern, text)
print(result)

<callable_iterator object ...>

for match in result:
    print(match.group())
    print(match.start())
```

```
john.smith@mailbox.com
0
22
boss@company.com
77
93
info@company.com
146
162
```

re.findall()

```
substrings = re.findall(pattern, text)

print(substrings)

['john.smith@mailbox.com', 'boss@company.com', 'info@company.com']
```

re.split()

```
split_list = re.split(pattern, text)
print(split_list)
  is the e-mail of John. He often writes to his boss at ',
  . But the messages get forwarded to his secretary at ',
```

Let's practice!

PRACTICING CODING INTERVIEW QUESTIONS IN PYTHON
